

Website Debugging Audit Report

Project: Code with Amrendra - Next.js Blog & Portfolio

1. SITE STRUCTURE (Parent & Child Pages)

Parent Pages (8):

- 1. / (Home)
- 2. /about
- 3. /blog
- 4. /categories
- 5. /contact
- 6. /hire-me
- 7. /privacy
- 8. /terms

Child Pages:

- /blog/[slug] (Individual Blog Posts)
- /category/[slug] (Category Specific Posts)

Orphan Pages:

- None. All pages are properly linked via Header, Footer or internal Components (like HeroSection).

2. DETAILED AUDIT REPORT TABLE

Issue Type	Page/Location	Problem Description	Severity	Suggested Fix
Buttons & Forms	Footer.js	Newsletter form action is set to action="#". Backend integration is missing. Submitting the form will just reload the page or add a hash to the URL.	High	Add a Formspree, Mailchimp, or Resend API endpoint to handle the submission.
Buttons & Forms	/contact/page.js	Contact form submission is fake. It uses a setTimeout to show a "success" status, but no data is actually sent.	High	Implement a backend API route or use a service like Formspree.
Buttons & Forms	/hire-me/page.js	Hire Me form uses a dummy setTimeout while the actual Formspree integration code is commented out.	High	Uncomment the Formspree code and replace YOUR_FORM_ID with the actual ID.
Links / Redirection	/hire-me/page.js	The CTA Footer section uses mailto:contact@amrendra.dev, whereas the /contact page uses amrendra1999official@gmail.com.	Medium	Use a single, consistent primary email address across the entire website.
Social Links	Footer.js & /contact	Twitter handle https://x.com/codewithamrendr is linked. (It looks like an 'a' might be missing at the end). YouTube link is missing from the Footer UI but present in Schema Markup.	Low	Verify the Twitter handle. Add a YouTube icon and link to the Footer UI.
Performance	layout.js & Footer.js	<html suppressHydrationWarning> and suppressHydrationWarning on elements are used manually in multiple places, indicating hydration mismatches were hidden rather than fixed.	Medium	Investigate if browser extensions (like Grammarly) caused this or if there's a real code mismatch. Fix the root cause if possible.
Layout / UI	All Pages	Mobile view grid layouts (md:grid-cols-1, lg:grid-cols-2) are well defined. CSS and Tailwind classes are mostly optimized.	Low	Perform a visual check on a real mobile device to ensure text doesn't overflow, especially inside <pre> tags in blog posts.
Technical SEO	/blog/[slug]/page.js	generateMetadata function generates dynamic SEO tags correctly. However, if a blog post's description or excerpt is missing in the database/markdown, Open Graph tags will be empty.	Low	Define a fallback default description just in case the excerpt is missing.

3. WHAT IS WORKING PERFECTLY (No Action Needed)

- **Technical SEO:**
 - sitemap.js and robots.js are properly configured and dynamically generated.
 - Canonical tags are correctly defined on all pages (layout.js, categories/page.js, blog/[slug]).
 - Schema Markup (Person and Article JSON-LD) is excellently implemented.
- **Social Media Structure:** All social links use , which is the best practice for security and SEO.
- **Layout Styling:** Dark mode/Light mode is properly handled via ThemeToggle and next-themes.
